

Armidale Sewage Treatment Plant (STP)

Location: 631 Cafferies Road, Armidale NSW 2350

Environment Protection Licence Number: 1722 Activities: Sewage treatment

Licensee under Protection of Environment Operations Act 1997 (POEO Act): Armidale Dumaresq Council, PO Box 75A, Armidale NSW 2350

The internet link to Licence No. 1722 is <http://www.epa.nsw.gov.au/prpoeoapp/ViewPOEOLicence.aspx?DOCID=30769&SYSUID=1&LICID=1722>

Council is required to monitor the volume and quality of outgoing treated wastewater (also called effluent). Up to 50% of the treated wastewater is used for irrigation on Council's surrounding cropping and grazing properties. Soils, biosolids, and groundwater are also tested to assist environmental management. This document details recent results. To meet its obligation under Section 66 (6) of the POEO Act, a link to the current version of this document is available on Council's website.

The locations of sampling points are shown on the adjacent figure. Some historical names are used. P stands for piezometer; WW = Windways Well. Corresponding Environment Protection Authority (EPA) Identification Numbers detailed on the Licence are provided below.

EPA Point No. 1 (quality monitoring - discharge to Commissioners Waters)

EPA Point No. 2 (soils and mass monitoring on 'Mt Kennedy' & areas A & B irrigation fields)

EPA Point No. 3 (volume monitoring for 'Mt Kennedy' & areas A, B & C)

EPA Point No. 4 (soils & mass monitoring 'Windways' irrigation field)

EPA Point No. 5 (volume monitoring of discharge to 'Windways')

EPA Point No. 6 (quality monitoring of electric pump discharge to 'Mt Kennedy' & areas A, B & C)

EPA Point No. 7 (quality monitoring of diesel pump discharge to 'Windways' irrigation areas)

EPA Point No. 8 (volume monitoring sludge lagoons)

EPA Point No. 9 (Biosolids monitoring)

EPA Point No. 10 (P6 groundwater monitoring)

EPA Point No. 11 (P7 groundwater monitoring)

EPA Point No. 12 (P17 groundwater monitoring)

EPA Point No. 13 (P14 groundwater monitoring)

EPA Point No. 14 (WW3 groundwater monitoring)

EPA Point No. 15 (WW2 groundwater monitoring)

EPA Point No. 16 (P3 groundwater monitoring)

EPA Point No. 17 (WW1 groundwater monitoring)

Monitoring results for the last four years are presented on following pages – as required in the EPA publishing requirements.

The following tables provide results required by licence. Some additional results are also provided. Results are organised in their field and laboratory presentation order.

Abbreviations in the tables are provided here in alphabetical order:

BOD₅ = Biochemical Oxygen Demand over five days; Ca = Calcium; Cl = Chloride; EC = Electrical Conductivity also called conductivity; ESP = Exchangeable Sodium Percentage: Ex = Exchangeable; FC = Faecal Coliforms; K = Potassium; Na = Sodium; Mg = Magnesium; NH₃ = Ammonia as a measure of ammonium ions; M = Monthly; NO₃ = Nitrate; NO_x = Nitrite + Nitrate = Nitrogen Oxides; NC = Not continuing; NR = Not required; OM = Organic Matter; O&G = Oil and Grease; PSC = Phosphorus Sorption Capacity; S = Sulphur; SAR = Sodium Absorption Ratio; SRP = Soluble Reactive Phosphorus (also RP); TSS = Total suspended solids; TKN = Total Kjeldahl Nitrogen (organic nitrogen + ammonia); TN = Total Nitrogen; TP = Total Phosphorus; Q = Quarterly.

Measures:

CFU/100mL = Colony Forming Units/100mL; dS/cm = deciSiemens per centimetre; mg/kg = milligram/kilogram; mg/L = milligram per litre (equivalent to ppm); μ S/cm = microSiemens per cm; < = less than, kL = kilolitres.

Limits:

90 percentile concentration - the monitoring results should not exceed the specified limit for 90% of the time, so for monthly tests, only 1 of the 12 results in the year should exceed the 90% concentration. These concentration limits apply to BOD, O&G, and TSS. For TN and TP, Council pays a fee based on the load (mass in the volume) discharged to Commissioners Waters.

Choice of water quality analytes:

Some analytes are tested because they give a general understanding of the discharge quality of treated effluent. For example, it is best that effluent used for irrigation or discharge to streams is not too salty. EC is an indicator of salt levels. It is best that EC be at least <1000 μ S/cm. The pH range recommended for discharged effluent is pH 6.5 to 8.5, which is not too acidic or too alkaline to harm the bacteria breaking down the effluent, or the stream biota. Reasons for some other analytes are as follows:

- The BOD₅ test has traditionally been used by wastewater professionals to manage wastewater treatment processes. It is measured by the quantity of oxygen consumed by microorganisms during a five-day period, as a measure of the amount of biodegradable organic material in, or strength of, sewage. Sewage high in BOD can deplete oxygen in receiving waters, causing fish kills and ecosystem changes. A common standard is to treat sewage so that the BOD₅ of treated effluent is less than 20 mg/L (i.e. 20 mg of O₂ are consumed per litre of water over 5 days to break down the waste).
- The volume of sludge produced in a treatment plant is directly related to the TSS present in the sewage. The extent to which a treatment plant removes suspended solids (SS), as well as BOD₅, determines the efficiency of the treatment process. Suspended solids can smother stream biota. A common standard is to treat sewage so that the TSS of the treated effluent is less than 30 mg/L.
- Chloride and sodium are major elements of salt that can cause foliar injury during irrigation.
- SAR (Sodium Absorption Ratio) indicates if soil may be affected by sodicity, that is, the presence of a high proportion of sodium (Na⁺) ions relative to calcium (Ca²⁺) and magnesium (Mg²⁺) ions in soil or water. Sodicity degrades soil structure by breaking down clay aggregates. This makes the soil more erodible, less permeable to water, and reduces plant growth. In general, the higher the sodium adsorption ratio, the less suitable the water is for irrigation. Plants have ranges of SAR tolerance. Examples: citrus trees can tolerate SAR 2 to 8; oats SAR 18 to 46; and wheat, cotton and barley SAR 4 to 102.
- Increased levels of faecal coliforms (FC) warn of problems with the effluent treatment and possible contamination with pathogens. Raw sewage FC counts are in the millions. Note the low counts of the treated effluent in Table 1.
- Ammonia as ammonium ions can cause fish kills and affect other stream biota. While travelling through sewer pipes, the majority of the nitrogen contained in raw sewage is converted from organic-nitrogen to ammonium compounds.
- At the sewage treatment works, bacteria remove nitrogen compounds from the effluent by a two-step biological process. The first step is nitrification in which ammonium is converted to nitrate nitrogen in aerobic conditions (with air). (NO_x is usually predominantly nitrate.) The second step is denitrification in which nitrate is reduced to nitrogen gas (N₂) in anaerobic conditions (without air). So testing for the various nitrogen compounds alerts to any problems in the sewage treatment process.

- Total Phosphorus (TP) is a component of animal and plant matter in sewage. SRP represents the fraction of TP that is available to organisms for growth. If discharged into streams in high quantities, it may stimulate growth of photosynthetic organisms such as algae. The discharged phosphorus is diluted many times in Commissioners Waters.

Frequency of measurement required by licence is daily, and the daily limits are **16,500 kL** for discharge to Commissioners Waters; and **7,000 kL** for only EPA Point 3, the Mt Kennedy irrigation areas.

Table 3 continued: Treated wastewater discharge & irrigation volumes
