

## Armidale Water Treatment Plant (WTP)

Location: Arundel Drive, Armidale NSW 2350    Environment Protection Licence Number: 2821    Activities: Drinking water treatment  
Licensee under Protection of Environment Operations Act 1997 (POEO Act): Armidale Regional Council, PO Box 75A, Armidale NSW 2350

The internet link to Licence No. 2821 is <http://www.epa.nsw.gov.au/prpoeoapp/ViewPOEOLicence.aspx?DOCID=31138&SYSUID=1&LICID=2821>

Council is required by the New South Wales Environment Protection Authority (EPA) to monitor the quality of water discharging from the final solids settlement pond outlet pit (EPA Point 1) and volume discharged daily. This document details recent results. To meet Council's obligation under Section 66 (6) of the POEO Act, a link to the current version of this document is available on Council's website.

The location of EPA Point No. 1 sampling point is shown on the adjacent figure.

Monitoring results from 31 March 2012 required under the licence are presented in the following tables. New results will be added over the next four years. From then on, the earliest result will be deleted each time a new result becomes available. In this way, the most current four years of results will always be available.

Discharge water quality results are provided in Table 1. Discharge water volumes are provided in Table 2.

Abbreviations in the tables are as follows:

AI = Aluminium; BOD<sub>5</sub> = Biochemical Oxygen Demand over five days; SS = Total suspended solids; mg/L = milligram per litre (equivalent to ppm); kL = kilolitres.

Base map: NSW Department of Lands 2010

Choice of water quality analytes:

Particular analytes are chosen for testing because they give an understanding of the discharge quality of the backwash water. Backwash water cleans the water treatment plant filters and sedimentation tanks and is then allowed to settle in three solids settlement ponds. Testing gives insight into the effectiveness of the water treatment process and how it may affect Rockvale Creek to which the water is discharged. Reasons for analytes are as follows:

- pH measures if the discharge water is acidic, neutral or alkaline. A neutral pH range between 6.5 and 8.5 is generally preferred so that freshwater aquatic ecosystems are not affected by extreme pH.
- Aluminium compounds are used to coagulate suspended particles in the raw water that arrives at the treatment plant. It is tested at the discharge point to assure that much of the aluminium has dropped out in the settlement tanks and the three solids settlement ponds.
- The BOD<sub>5</sub> test has traditionally been used by wastewater professionals to manage wastewater treatment processes. It is measured by the quantity of oxygen consumed by microorganisms during a five-day period, as a measure of the amount of biodegradable organic material in, or strength of, the wastewater. Wastewater high in BOD can deplete oxygen in receiving waters, causing fish kills and ecosystem changes. A commonly accepted wastewater treatment discharge standard for BOD<sub>5</sub> is 20 mg/L (i.e. 20 mg of O<sub>2</sub> are consumed per litre of water over 5 days to break down the waste).
- Suspended solids (SS) are removed during settlement in the sludge lagoons. Along with BOD<sub>5</sub>, SS determines the efficiency of the treatment process. Suspended solids can also smother biota in waterbodies. A commonly accepted treatment standard for suspended solids is 30 mg/L.

Notes:  
Frequency of testing required by licence is weekly.  
Aluminium samples filtered from October 2012.

**Table 2: Discharge volumes Year 2012 for EPA Point No. 1** (from electronic daily backwash flow measurements) Frequency of measurement required by licence is daily, and the daily limit is 2,000 kL.
